

## Tips & Tricks

### But Mom, I Don't Wanna Logon!

---

Do you get an annoying network logon screen every time you boot Windows? Well, here's a way that *should* get rid of it for you.

**Please note** that if you have your computer set up for multiple users, this tip isn't for you. Additionally, if you are on a network and a password is required to get onto your network, this little trick probably won't work (if no password is required, then you *should* be OK, but check with your network administrator first).

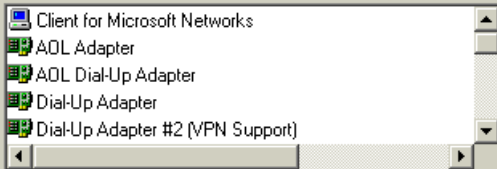

Everyone else should be fine.

If you're still with me, here's how to rid yourself of that annoying logon screen:

1. Click Start, Settings, Control Panel
2. Next, open the Network Icon.
3. Finally, change the item in the Primary Network Logon drop down box to "Windows Logon". It's probably a good idea to write down whatever was in the "Primary Network Login" box before you change it. Just in case...

Configuration Identification Access Control

The following network components are installed:

Add...

Remove

Properties

Primary Network Logon:

Windows Logon

File and Print Sharing...

Description

The primary network logon is the client that is used to validate your user name and password, process any login scripts, and perform other startup tasks.

OK

Cancel

That's it. You should no longer have a logon screen pop up when you start Windows.
